

HYDRODYNAMIC LIMIT OF GRADIENT EXCLUSION PROCESSES WITH CONDUCTANCES ON $\mathbb{Z}^d$

FÁBIO J. VALENTIM

ABSTRACT. Fix a smooth function $\Phi : [l, r] \rightarrow \mathbb{R}$, defined on some interval $[l, r]$ of $\mathbb{R}$, such that $0 < b \leq \Phi' \leq b^{-1}$. We prove that the evolution, on the diffusive scale, of the empirical density of exclusion processes in $\mathbb{Z}^d$, with conductances given by special class of functions W , is described by the weak solutions of the non-linear parabolic partial differential equation $\partial_t \rho = \sum_{k=1}^d (d/dx_k)(d/dW_k)\Phi(\rho)$. We also derive some properties of the operator $\sum_{k=1}^d (d/dx_k)(d/dW_k)$.

1. INTRODUCTION

We consider exclusion processes with conductances given by a special class of functions $W : \mathbb{R}^d \rightarrow \mathbb{R}$, such that $W(x_1, \dots, x_d) = \sum_{k=1}^d W_k(x_k)$, where $d > 1$ and each function $W_k : \mathbb{R} \rightarrow \mathbb{R}$ is strictly increasing, right continuous with left limits (càdlàg), and periodic in the sense that $W_k(u+1) - W_k(u) = W_k(1) - W_k(0)$ for all $u \in \mathbb{R}$. We show that, on the diffusive scale, the macroscopic evolution of the empirical density of exclusion processes is described by the nonlinear differential equation

$$\partial_t \rho = \sum_{k=1}^d \frac{d}{dx_k} \frac{d}{dW_k} \Phi(\rho), \quad (1.1)$$

where Φ is a smooth function strictly increasing in the range of ρ such that $0 < b \leq \Phi' \leq b^{-1}$ and $\frac{d}{dW_k}$ denotes the generalized derivative, see [1, 3] and a revision in section 3. In Theorem 2.1 we show that the operator $\sum_{k=1}^d (d/dx_k)(d/dW_k)$, defined on an appropriate domain, is non-positive, self-adjoint and dissipative; moreover, its eigenvalues are countable and have finite multiplicity, the associated eigenvectors forming a complete orthonormal system. Thus, we obtain the infinitesimal generator of a reversible Markov process. These properties have been proved in [3] for the one-dimensional case, i.e., $d = 1$.

The main tool used was the theory of energetic spaces and Friedrichs extension, see, for instance, [14, chapter 5]. In our case, we build the operator with the above properties by using the one-dimensional case, see section 3.

The discrete version of the generator $\sum_{k=1}^d (d/dx_k)(d/dW_k)$ admits a decomposition by generators of random walks with conductances also given by W . This allows using the method in [3, 2] to understand the scaling limit of the process.

We consider auxiliary Markov processes associated with the empirical measure acting in the resolvent of the random walk. Since the trajectories are càdlàg, it is

usual that these processes are endowed with the Skorohod topology [2, 5, 11, 7]. However, here, the processes are endowed with the uniform topology, analogous to [3].

As said in the introduction of [3], non-linear versions of the partial differential equation (1.1), $d = 1$, appear naturally as scaling limits of interacting particle systems in inhomogeneous media. They may model diffusions in which permeable membranes, at the points of discontinuities of W , tend to reflect particles, creating space discontinuities in the solutions. But when $d \geq 2$, it is not obvious that we should also have this effect. In fact, the particles may have other options of movement. However, for this special class of functions that we are considering here, that also provides conductances for the process, we have the same effect found in the one-dimensional case.

Models with conductances have attracted the attention of several authors. An extensive list can be found at [3, 13]. Recently [4] has shown homogenization results for the random walk among random conductances on an infinite cluster in $\mathbb{Z}^d$. In [10], the author proves an almost sure invariance principle for a random walker among i.i.d. conductances in $\mathbb{Z}^d$, $d \geq 2$.

The paper is structured as follows. In Section 2 we present the dynamics of the above exclusion process, formalize the notations used in the paper and list the main results. In Section 3 we build the operator $\sum_{k=1}^d (d/dx_k)(d/dW_k)$ with the properties listed above. Section 4 is a preparation for Section 5, the discrete exclusion process is decomposed in terms of the random walk and we prove some results involving the transition and resolvent functions of the processes involved. In section 5, we prove the scaling limit. Finally, in Section 6 we show that the solutions of (1.1) have finite energy.

2. NOTATION AND RESULTS

We examine the hydrodynamic behavior of a d -dimensional exclusion process, $d > 1$, with conductances given by a special class of functions $W : \mathbb{R}^d \rightarrow \mathbb{R}$ such that:

$$W(x_1, \dots, x_d) = \sum_{k=1}^d W_k(x_k) \quad (2.1)$$

where $W_k : \mathbb{R} \rightarrow \mathbb{R}$ are right continuous with left limits (càdlàg) *strictly increasing* functions, periodic in the sense that

$$W_k(u+1) - W_k(u) = W_k(1) - W_k(0)$$

for all $u \in \mathbb{R}$ and $k = 1, \dots, d$. To keep notation simple, we assume that W_k vanishes at the origin, $W_k(0) = 0$.

Denote by $\mathbb{T}^d = [0, 1]^d$ the d -dimensional torus and by $e_1, \dots, e_d$ the canonical basis of $\mathbb{R}^d$. For this class of functions we have:

- $W(0) = 0$,
- W is strictly increasing on each coordinate:

$$W(x + ae_j) > W(x)$$

for all $1 \leq j \leq d$, $a > 0$, $x \in \mathbb{R}^d$;

- W is continuous from above:

$$W(x) = \lim_{y \rightarrow x, y \geq x} W(y),$$

- where we say that $y \geq x$ if $y_j \geq x_j$ for all $1 \leq j \leq d$.
- W is defined on the torus $\mathbb{T}^d$:

$$W(x_1, \dots, x_{j-1}, 0, x_{j+1}, \dots, x_d) = W(x_1, \dots, x_{j-1}, 1, x_{j+1}, \dots, x_d) - W(e_j),$$

$$\text{for all } 1 \leq j \leq d, (x_1, \dots, x_{j-1}, x_{j+1}, \dots, x_d) \in \mathbb{T}^{d-1}.$$

Unless explicitly stated W belongs to this class. Let $\mathbb{T}_N^d$ be the d -dimensional discrete torus with N^d points. Distribute particles throughout $\mathbb{T}_N^d$ in such a way that each site of $\mathbb{T}_N^d$ is occupied by at most one particle. Denote by η the configurations of the state space $\{0, 1\}^{\mathbb{T}_N^d}$, so that $\eta(x) = 0$ if site x is vacant and $\eta(x) = 1$ if site x is occupied.

Fix $a > -1/2$ and W , for $x = (x_1, \dots, x_d) \in \mathbb{T}_N^d$ let

$$c_{x, x+e_j}(\eta) = 1 + a\{\eta(x - e_j) + \eta(x + 2e_j)\},$$

where all sums are modulo N , and let

$$\xi_{x, x+e_j} = \frac{1}{N[W((x + e_j)/N) - W(x/N)]} = \frac{1}{N[W_j((x_j + 1)/N) - W_j(x_j/N)]}.$$

The stochastic evolution can be described as follows. Let $x = (x_1, \dots, x_d) \in \mathbb{T}_N^d$. At rate $\xi_{x, x+e_j} c_{x, x+e_j}(\eta)$ the occupation variables $\eta(x)$, $\eta(x + e_j)$ are exchanged. If W is differentiable at $x/N \in [0, 1]^d$, the rate at which particles are exchanged is of order 1 for each direction, but if some W_j is discontinuous at x_j/N , the rate is of order $1/N$. Assume, to fix ideas, that W_j is discontinuous at x_j/N , smooth on the segment $(x_j/N, x_j/N + \varepsilon e_j)$, $(x_j/N - \varepsilon e_j, x_j/N)$ and that W_k is differentiable in x_k/N for $k \neq j$. In this case, the rate at which particles jump over the bond $\{x - e_j, x\}$ is of order $1/N$, while in a neighborhood of size N of this bond, particles jump at rate 1. In particular, a particle at site $x - e_j$ jumps to x at rate $1/N$ and jumps at rate 1 to each of the $2d - 1$ other options. Particles, therefore, tend to avoid the bond $\{x - e_j, x\}$. For the one-dimensional case (see [3]) it was shown that, on a time interval of length N^2 , a particle spends a time of order N at site x , hence particles will jump slower over the bond $\{x - e_j, x\}$. This bond may, for instance, model a membrane which obstructs the passage of particles. However, in the d -dimensional case, particles have the possibility to go from $x - e_j$ to x , without having to jump over the bond $\{x - e_j, x\}$. One may argue that these discontinuity points would not serve as barriers anymore. However, for the same time interval and scaling considered in the one-dimensional case, a particle will jump slower over the bond $\{x - e_j, x\}$. This is due to the fact that any path that begins at $x - e_j$ and ends at x , or vice-versa, will necessarily have a j -th coordinate $\{x_j - 1, x_j\}$, for some x_j . Then, this process also models membranes that obstruct passages of particles. Notice that these membranes are $(d - 1)$ -dimensional hyperplanes embedded in a d -dimensional environment.

The effect of the factor $c_{x, x+e_j}(\eta)$ is analogous to the one-dimensional case. If the parameter a is positive, the presence of particles in the neighboring sites of the bond $\{x, x + e_j\}$ speeds up the exchange rate by a factor of order one.

The dynamics informally presented describes a Markov evolution. The generator L_N of this Markov process acts on functions $f : \{0, 1\}^{\mathbb{T}_N^d} \rightarrow \mathbb{R}$ as

$$(L_N f)(\eta) = \sum_{j=1}^d \sum_{x \in \mathbb{T}_N^d} \xi_{x, x+e_j} c_{x, x+e_j}(\eta) \{f(\sigma^{x, x+e_j} \eta) - f(\eta)\}, \quad (2.2)$$

where $\sigma^{x, x+e_j}\eta$ is the configuration obtained from η by exchanging the variables $\eta(x)$ and $\eta(x+e_j)$:

$$(\sigma^{x, x+e_j}\eta)(y) = \begin{cases} \eta(x+e_j) & \text{if } y = x, \\ \eta(x) & \text{if } y = x+e_j, \\ \eta(y) & \text{otherwise.} \end{cases} \quad (2.3)$$

A straightforward computation shows that the Bernoulli product measures $\{\nu_\alpha^N : 0 \leq \alpha \leq 1\}$ are invariant, and in fact reversible, for the dynamics. The measure ν_α^N is obtained by placing a particle at each site, independently from the other sites, with probability α . Thus, ν_α^N is a product measure over $\{0, 1\}^{\mathbb{T}_N^d}$ with marginals given by

$$\nu_\alpha^N \{\eta : \eta(x) = 1\} = \alpha$$

for x in $\mathbb{T}_N^d$. For more details see [7, chapter 2]. We will often omit the index N on ν_α^N .

Denote by $\{\eta_t : t \geq 0\}$ the Markov process on $\{0, 1\}^{\mathbb{T}_N^d}$ associated to the generator L_N speeded up by N^2 . Let $D(\mathbb{R}_+, \{0, 1\}^{\mathbb{T}_N^d})$ be the path space of càdlàg trajectories with values in $\{0, 1\}^{\mathbb{T}_N^d}$. For a measure μ_N on $\{0, 1\}^{\mathbb{T}_N^d}$, denote by $\mathbb{P}_{\mu_N}$ the probability measure on $D(\mathbb{R}_+, \{0, 1\}^{\mathbb{T}_N^d})$ induced by the initial state μ_N and the Markov process $\{\eta_t : t \geq 0\}$. Expectation with respect to $\mathbb{P}_{\mu_N}$ is denoted by $\mathbb{E}_{\mu_N}$.

2.1. The operator $\mathcal{L}_W$. Fix $W = \sum_{k=1}^d W_k$ as in (2.1). In [3] it is shown the existence of self-adjoint operators $\mathcal{L}_{W_k} : \mathcal{D}_{W_k} \subset L^2(\mathbb{T}) \rightarrow L^2(\mathbb{T})$. Further, the set $\mathcal{A}_{W_k}$ of the eigenvectors of $\mathcal{L}_{W_k}$ forms a complete orthonormal system in $L^2(\mathbb{T})$. Let

$$\mathcal{A}_W = \{f : \mathbb{T}^d \rightarrow \mathbb{R}; f(x_1, \dots, x_d) = \prod_{k=1}^d f_k(x_k), f_k \in \mathcal{A}_{W_k}, k = 1, \dots, d\}.$$

Denote by $\text{span}(A)$ the space of finite linear combinations of the set A , and $\mathbb{D}_W := \text{span}(\mathcal{A}_W)$. Define the operator $\mathbb{L}_W : \mathbb{D}_W \rightarrow L^2(\mathbb{T}^d)$ as follows. For $f = \prod_{k=1}^d f_k \in \mathcal{A}_W$, we have

$$\mathbb{L}_W(f)(x_1, \dots, x_d) = \sum_{k=1}^d \prod_{j=1, j \neq k}^d f_j(x_j) \mathcal{L}_{W_k} f_k(x_k), \quad (2.4)$$

and we then extend to $\mathbb{D}_W$ by linearity.

Lemma 3.2, in Section 3, shows that $\mathbb{L}_W$ is symmetric and non-positive; $\mathbb{D}_W$ is dense in $L^2(\mathbb{T}^d)$; and the set $\mathcal{A}_W$ forms a complete, orthonormal, countable system of eigenvectors for the operator $\mathbb{L}_W$. Let $\mathcal{A}_W = \{h_k\}_{k \geq 0}$, $\{\alpha_k\}_{k \geq 0}$ be the corresponding eigenvalues of $-\mathbb{L}_W$, and consider $\mathcal{D}_W = \{v = \sum_{k=1}^\infty v_k h_k \in L^2(\mathbb{T}^d); \sum_{k=1}^\infty v_k^2 \alpha_k^2 < +\infty\}$. We define the operator $\mathcal{L}_W : \mathcal{D}_W \rightarrow L^2(\mathbb{T}^d)$ by

$$-\mathcal{L}_W v = \sum_{k=1}^{+\infty} \alpha_k v_k h_k \quad (2.5)$$

The operator $\mathcal{L}_W$ is clearly an extension of the operator $\mathbb{L}_W$, and we present in Theorem 2.1 some properties of this operator.

Theorem 2.1. *The operator $\mathcal{L}_W : \mathcal{D}_W \rightarrow L^2(\mathbb{T}^d)$ enjoys the following properties.*

- (a) The domain $\mathcal{D}_W$ is dense in $L^2(\mathbb{T}^d)$. In particular, the set of eigenvectors $\mathcal{A}_W = \{h_k\}_{k \geq 0}$ forms a complete orthonormal system;
- (b) The eigenvalues of the operator $-\mathcal{L}_W$ form a countable set $\{\alpha_k\}_{k \geq 0}$. All eigenvalues have finite multiplicity, and it is possible to obtain a re-enumeration $\{\alpha_k\}_{k \geq 0}$ such that

$$0 = \alpha_0 \leq \alpha_1 \leq \dots \quad \text{and} \quad \lim_{n \rightarrow \infty} \alpha_n = \infty;$$

- (c) The operator $\mathbb{I} - \mathcal{L}_W : \mathcal{D}_W \rightarrow L^2(\mathbb{T}^d)$ is bijective;
- (d) $\mathcal{L}_W : \mathcal{D}_W \rightarrow L^2(\mathbb{T}^d)$ is self-adjoint and non-positive:

$$\langle -\mathcal{L}_W f, f \rangle \geq 0;$$

- (e) $\mathcal{L}_W$ is dissipative.

In view of (a), (b) and (d), by Hille-Yosida theorem, $\mathcal{L}_W$ is the generator of a strongly continuous contraction semi-group $\{P_t : L^2(\mathbb{T}^d) \rightarrow L^2(\mathbb{T}^d)\}_{t \geq 0}$.

Denote by $\{G_\lambda : L^2(\mathbb{T}^d) \rightarrow L^2(\mathbb{T}^d)\}_{\lambda > 0}$ the semi-group of resolvents associated to the operator $\mathcal{L}_W$: $G_\lambda = (\lambda - \mathcal{L}_W)^{-1}$. G_λ can also be written in terms of the semi-group $\{P_t ; t \geq 0\}$:

$$G_\lambda = \int_0^\infty e^{-\lambda t} P_t dt.$$

In Section 4 we derive some properties and obtain some results for these operators.

2.2. The hydrodynamic equation. A sequence of probability measures $\{\mu_N : N \geq 1\}$ on $\{0, 1\}^{\mathbb{T}_N^d}$ is said to be associated to a profile $\rho_0 : \mathbb{T}^d \rightarrow [0, 1]$ if

$$\lim_{N \rightarrow \infty} \mu_N \left\{ \left| \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H(x/N) \eta(x) - \int H(u) \rho_0(u) du \right| > \delta \right\} = 0 \quad (2.6)$$

for every $\delta > 0$ and every continuous function $H : \mathbb{T}^d \rightarrow \mathbb{R}$. For details, see [7, chapter 3].

For a positive integer $m \geq 1$, denote by $C^m(\mathbb{T}^d)$ the space of continuous functions $H : \mathbb{T}^d \rightarrow \mathbb{R}$ with m continuous derivatives. Fix $l < r$ and a smooth function $\Phi : [l, r] \rightarrow \mathbb{R}$ whose derivative is bounded below by a strictly positive constant and bounded above by a finite constant:

$$0 < B^{-1} \leq \Phi'(x) \leq B$$

for all $x \in [l, r]$. Let $\gamma : \mathbb{T}^d \rightarrow [l, r]$ be a bounded density profile and consider the parabolic differential equation

$$\begin{cases} \partial_t \rho = \mathcal{L}_W \Phi(\rho) \\ \rho(0, \cdot) = \gamma(\cdot) \end{cases}. \quad (2.7)$$

A bounded function $\rho : \mathbb{R}_+ \times \mathbb{T}^d \rightarrow [l, r]$ is said to be a weak solution of the parabolic differential equation (2.7) if

$$\langle \rho_t, G_\lambda H \rangle - \langle \gamma, G_\lambda H \rangle = \int_0^t \langle \Phi(\rho_s), \mathcal{L}_W G_\lambda H \rangle ds$$

for every continuous function $H : \mathbb{T}^d \rightarrow \mathbb{R}$, all $t > 0$ and all $\lambda > 0$.

Existence follows from tightness of the sequence of probability measures $\mathbb{Q}_{\mu_N}^{W,N}$ introduced in Section 5. The proof of uniqueness of weak solutions is analogous to [3].

Theorem 2.2. *Fix a continuous initial profile $\rho_0 : \mathbb{T}^d \rightarrow [0, 1]$ and consider a sequence of probability measures μ_N on $\{0, 1\}^{\mathbb{T}_N^d}$ associated to ρ_0 , in the sense of 2.6. Then, for any $t \geq 0$,*

$$\lim_{N \rightarrow \infty} \mathbb{P}_{\mu_N} \left\{ \left| \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H(x/N) \eta_t(x) - \int H(u) \rho(t, u) du \right| > \delta \right\} = 0$$

for every $\delta > 0$ and every continuous function H . Here, ρ is the unique weak solution of the non-linear equation (2.7) with $l = 0$, $r = 1$, $\gamma = \rho_0$ and $\Phi(\alpha) = \alpha + a\alpha^2$.

Remark 2.3. *The specific form of the rates $c_{x, x+e_i}$ is not important, but two conditions must be fulfilled. The rates must be strictly positive, they may not depend on the occupation variables $\eta(x)$, $\eta(x+e_i)$, but they have to be chosen in such a way that the resulting process is gradient. (cf. Chapter 7 in [7] for the definition of gradient processes).*

We may define rates $c_{x, x+e_i}$ to obtain any polynomial Φ of the form $\Phi(\alpha) = \alpha + \sum_{2 \leq j \leq m} a_j \alpha^j$, $m \geq 1$, with $1 + \sum_{2 \leq j \leq m} j a_j > 0$. Let, for instance, $m = 3$ then the rates

$$\begin{aligned} \hat{c}_{x, x+e_i}(\eta) &= c_{x, x+e_i}(\eta) + \\ &b \{ \eta(x-2e_i) \eta(x-e_i) + \eta(x-e_i) \eta(x+2e_i) + \eta(x+2e_i) \eta(x+3e_i) \}, \end{aligned}$$

satisfy the above three conditions, where $c_{x, x+e_i}$ is the rate defined at the beginning of Section 2 and a, b are such that $1 + 2a + 3b > 0$. An elementary computation shows that $\Phi(\alpha) = 1 + a\alpha^2 + b\alpha^3$.

In Section 6 we prove that any limit point $\mathbb{Q}_W^*$ of the sequence $\mathbb{Q}_{\mu_N}^{W,N}$ is concentrated on trajectories $\rho(t, u)du$ with finite energy in the following sense: for each $1 \leq j \leq d$, there is a Hilbert space $L_{x_j \otimes W_j}^2$, associated to W_j , such that

$$\int_0^t ds \left\| \frac{d}{dW_j} \Phi(\rho(s, \cdot)) \right\|_{x_j \otimes W_j}^2 < \infty,$$

where $\|\cdot\|_{x_j \otimes W_j}$ is the norm in $L_{x_j \otimes W_j}^2$ and d/dW_j is the derivative, which must be understood in the generalized sense.

3. THE OPERATOR $\mathcal{L}_W$

The operator $\mathcal{L}_W : \mathcal{D}_W \subset L^2(\mathbb{T}^d) \rightarrow L^2(\mathbb{T}^d)$ is a natural extension, for the d -dimensional case, of the self-adjoint operator obtained for the one-dimensional case in [3].

We begin by presenting one of the main results obtained in [3], and we then present the necessary modifications to conclude similar results for the d -dimensional case.

3.1. Some remarks on the one-dimensional case. Denote by $\langle \cdot, \cdot \rangle$ the inner product of $L^2(\mathbb{T})$, where $\mathbb{T} \subset \mathbb{R}$ is the one-dimensional torus:

$$\langle f, g \rangle = \int_{\mathbb{T}} f(u) g(u) du .$$

Let $W_1 : \mathbb{R} \rightarrow \mathbb{R}$ be a *strictly increasing* right continuous function, with left limits (càdlàg), and periodic in the sense that $W_1(u+1) - W_1(u) = W_1(1) - W_1(0)$ for all u in $\mathbb{R}$.

Let $\mathcal{D}_{W_1}$ be the set of functions f in $L^2(\mathbb{T})$ such that

$$f(x) = a + bW_1(x) + \int_{(0,x]} W_1(dy) \int_0^y \mathfrak{f}(z) dz ,$$

for some function $\mathfrak{f}$ in $L^2(\mathbb{T})$ such that

$$\int_0^1 \mathfrak{f}(z) dz = 0 , \quad \int_{(0,1]} W_1(dy) \left(b + \int_0^y \mathfrak{f}(z) dz \right) = 0$$

Define the operator $\mathcal{L}_{W_1} : \mathcal{D}_{W_1} \rightarrow L^2(\mathbb{T})$ by $\mathcal{L}_{W_1} f = \mathfrak{f}$. Formally

$$\mathcal{L}_{W_1} f = \frac{d}{dx} \frac{d}{dW_1} f , \quad (3.1)$$

where the generalized derivative d/dW_1 is defined as

$$\frac{df}{dW_1}(x) = \lim_{\epsilon \rightarrow 0} \frac{f(x+\epsilon) - f(x)}{W_1(x+\epsilon) - W_1(x)} , \quad (3.2)$$

if the above limit exists and is finite.

Denote by $\mathbb{I}$ the identity operator in $L^2(\mathbb{T})$.

Theorem 3.1. *The operator $\mathcal{L}_{W_1} : \mathcal{D}_{W_1} \rightarrow L^2(\mathbb{T})$ enjoys the following properties:*

- (a) $\mathcal{D}_{W_1}$ is dense in $L^2(\mathbb{T})$;
- (b) The operator $\mathbb{I} - \mathcal{L}_{W_1} : \mathcal{D}_{W_1} \rightarrow L^2(\mathbb{T})$ is bijective;
- (c) $\mathcal{L}_{W_1} : \mathcal{D}_{W_1} \rightarrow L^2(\mathbb{T})$ is self-adjoint and non-positive:

$$\langle -\mathcal{L}_{W_1} f, f \rangle \geq 0 ;$$

- (d) $\mathcal{L}_{W_1}$ is dissipative i.e., for all $g \in \mathcal{D}_W$ and $\lambda > 0$, we have

$$\|\lambda g\| \leq \|(\lambda \mathbb{I} - \mathcal{L}_{W_1})g\| ;$$

- (e) The eigenvalues of the operator $-\mathcal{L}_W$ form a countable set $\{\lambda_n : n \geq 0\}$. All eigenvalues have finite multiplicity, $0 = \lambda_0 \leq \lambda_1 \leq \dots$, and $\lim_{n \rightarrow \infty} \lambda_n = \infty$;
- (f) The eigenvectors $\{f_n\}_{n \geq 0}$ of the operator $\mathcal{L}_W$ form a complete orthonormal system.

The proof can be found in [3].

3.2. The d -dimensional case. Consider W as in (2.1). Let $\mathcal{A}_{W_k}$ be the countable complete orthonormal system of eigenvectors for the operator $\mathcal{L}_{W_k} : \mathcal{D}_{W_k} \subset L^2(\mathbb{T}) \rightarrow \mathbb{R}$ given by Theorem 3.1. Let

$$\mathcal{A}_W = \{f : \mathbb{T}^d \rightarrow \mathbb{R}; f(x_1, \dots, x_d) = \prod_{k=1}^d f_k(x_k), f_k \in \mathcal{A}_{W_k}\} .$$

Note that, by Fubini's theorem, the set $\mathcal{A}_W$ is orthonormal in $L^2(\mathbb{T}^d)$, and the constant functions are eigenvectors for the operator $\mathcal{L}_{W_k}$. Moreover, $\mathcal{A}_{W_k} \subset \mathcal{A}_W$, in the sense that $f_k(x_1, \dots, x_d) = f_k(x_k)$, $f_k \in \mathcal{A}_{W_k}$.

Define the operator $\mathbb{L}_W : \mathbb{D}_W := \text{span}(\mathcal{A}_W) \rightarrow L^2(\mathbb{T}^d)$ as follows: for $f = \prod_{k=1}^d f_k \in \mathcal{A}_W$,

$$\mathbb{L}_W(f)(x_1, \dots, x_d) = \sum_{k=1}^d \prod_{j=1, j \neq k}^d f_j(x_j) \mathcal{L}_{W_k} f_k(x_k), \quad (3.3)$$

and extend to $\mathbb{D}_W$ by linearity.

By (3.1), the operators $\mathcal{L}_{W_k}$ can be formally extended to functions defined on $\mathbb{T}^d$ as follows. Given a function $f : \mathbb{T}^d \rightarrow \mathbb{R}$, we define $\mathcal{L}_{W_k} f$ as

$$\mathcal{L}_{W_k} f = \frac{d}{dx_k} \frac{d}{dW_k} f, \quad (3.4)$$

where the generalized derivative d/dW_k is defined by

$$\frac{df}{dW_k}(x_1, \dots, x_k, \dots, x_d) = \lim_{\epsilon \rightarrow 0} \frac{f(x_1, \dots, x_k + \epsilon, \dots, x_d) - f(x_1, \dots, x_k, \dots, x_d)}{W_k(x_k + \epsilon) - W_k(x_k)}, \quad (3.5)$$

if the above limit exists and is finite. Hence, by (3.3), if $f \in \mathbb{D}_W$

$$\mathbb{L}_W f = \sum_{k=1}^d \mathcal{L}_{W_k} f. \quad (3.6)$$

Note that if $f = \prod_{k=1}^d f_k$, where $f_k \in \mathcal{A}_{W_k}$ is an eigenvector of $\mathcal{L}_{W_k}$ associated to the eigenvalue λ_k , then f is an eigenvector of $\mathbb{L}_W$ with eigenvalue $\sum_{k=1}^d \lambda_k$.

Lemma 3.2. *The following statements hold:*

- (a) *The set $\mathbb{D}_W$ is dense in $L^2(\mathbb{T}^d)$;*
- (b) *The operator $\mathbb{L}_W : \mathbb{D}_W \rightarrow L^2(\mathbb{T}^d)$ is symmetric and non-positive:*

$$\langle -\mathbb{L}_W f, f \rangle \geq 0.$$

Proof. The strategy to prove the above lemma is the following. We begin by showing that the set

$$\mathcal{S} = \text{span}(\{f \in L^2(\mathbb{T}^d); f(x_1, \dots, x_d) = \prod_{k=1}^d f_k(x_k), f_k \in \mathcal{D}_{W_k}\})$$

is dense in

$$\mathbb{S} = \text{span}(\{f \in L^2(\mathbb{T}^d); f(x_1, \dots, x_d) = \prod_{k=1}^d f_k(x_k), f_k \in L^2(\mathbb{T})\}).$$

We then show that $\mathbb{D}_W$ is dense in $\mathcal{S}$. Since $\mathbb{S}$ is dense in $L^2(\mathbb{T}^d)$, item (a) follows.

We now prove item (a) rigorously. Since $\mathcal{S}$ is a vector space, we only have to show that we can approximate the functions $\prod_{k=1}^d f_k \in L^2(\mathbb{T}^d)$, where $f_k \in \mathcal{D}_{W_k}$, by functions of $\mathbb{D}_W$. By Theorem 3.1, the set $\mathcal{D}_{W_k}$ is dense in $L^2(\mathbb{T})$, thus, there is a sequence $(f_n^k)_{n \in \mathbb{N}}$ converging to f_k in $L^2(\mathbb{T})$. Thus Let

$$f_n(x_1, \dots, x_d) = \prod_{k=1}^d f_n^k(x_k).$$

By the triangle inequality and Fubini's theorem, the sequence (f_n) converges to $\prod_{k=1}^d f_k$. Fix $\epsilon > 0$ and let

$$h(x_1, \dots, x_d) = \prod_{k=1}^d h_k(x_k), \quad h_k \in \mathcal{D}_{W_k}.$$

Since for each $k = 1 \dots, d$, $\mathcal{A}_{W_k} \subset \mathcal{D}_{W_k}$ is a complete orthonormal set, there exist sequences $g_j^k \in \mathcal{A}_{W_k}$ and $\alpha_j^k \in \mathbb{R}$ such that

$$\|h_k - \sum_{j=1}^{n(k)} \alpha_j^k g_j^k\|_{L^2(\mathbb{T})} < \delta,$$

where $\delta = \epsilon/dM^{d-1}$ and $M := 1 + \sup_{k=1:n} \|h_k\|$. Let

$$g(x_1, \dots, x_d) = \prod_{k=1}^d \sum_{j=1}^{n(k)} \alpha_j^k g_j^k(x_k) \in \mathbb{D}_W.$$

An application of the triangle inequality and Fubini's theorem yields $\|h - g\| < \epsilon$. This proves (a).

To prove (b), let

$$f(x_1, \dots, x_d) = \prod_{k=1}^d f_k(x_k) \quad \text{and} \quad g(x_1, \dots, x_d) = \prod_{k=1}^d g_k(x_k)$$

be functions belonging to $\mathcal{A}_W$. We have that

$$\langle f, \mathbb{L}_W g \rangle = \left\langle \prod_{k=1}^d f_k, \sum_{k=1}^d \prod_{j=1, j \neq k}^d g_j \mathcal{L}_{W_k} g_k \right\rangle = \sum_{k=1}^d \left\langle \prod_{j=1, j \neq k}^d f_j g_j, f_k \mathcal{L}_{W_k} g_k \right\rangle,$$

where $\langle \cdot, \cdot \rangle$ denotes the inner product in $L^2(\mathbb{T}^d)$. Since, by Theorem 3.1, $\mathcal{L}_{W_k}$ is self-adjoint, we have

$$\sum_{k=1}^d \left\langle \prod_{j=1, j \neq k}^d f_j g_j, g_k \mathcal{L}_{W_k} f_k \right\rangle = \langle \mathcal{L}_W f, g \rangle.$$

In particular, the operator $\mathcal{L}_{W_k}$ is non-positive and therefore

$$\langle f, \mathbb{L}_W f \rangle = \sum_{k=1}^d \left\langle \prod_{j=1, j \neq k}^d f_j^2, f_k \mathcal{L}_{W_k} f_k \right\rangle \leq 0.$$

Item (b) follows by linearity. $\square$

Lemma 3.2 implies that the set $\mathcal{A}_W$ forms a complete orthonormal countable system of eigenvectors for the operator $\mathbb{L}_W$. Let $\mathcal{A}_W = \{h_k\}_{k \geq 0}$, and let $\{\alpha_k\}_{k \geq 0}$ be the corresponding eigenvalues of $-\mathbb{L}_W$. Consider

$$\mathcal{D}_W = \{v = \sum_{k=1}^{\infty} v_k h_k \in L^2(\mathbb{T}^d); \sum_{k=1}^{\infty} v_k^2 \alpha_k^2 < +\infty\},$$

and define

$$-\mathcal{L}_W v = \sum_{k=1}^{+\infty} \alpha_k v_k h_k. \quad (3.7)$$

The operator $\mathcal{L}_W$ is clearly an extension of the operator $\mathbb{L}_W$. Formally, by (3.6),

$$\mathcal{L}_W f = \sum_{k=1}^d \mathcal{L}_{W_k} f, \quad (3.8)$$

where

$$\mathcal{L}_{W_k} f = \frac{d}{dx_k} \frac{d}{dW_k} f.$$

We are now in conditions to prove Theorem 2.1.

Proof of Theorem 2.1. Since $\mathbb{D}_W \subset \mathcal{D}_W$, the density of $\mathcal{D}_W$ in $L^2(\mathbb{T}^d)$ follows from the density of $\mathbb{D}_W$, shown in lemma 3.2.

If α_k are eigenvalues of $-\mathcal{L}_W$, we may find eigenvalues λ_j , associated to some $f_j \in \mathcal{A}_{W_j}$, such that $\alpha_k = \sum_{j=1}^d \lambda_j$. By Theorem 3.1[item (e)], (b) follows.

Let $\{\alpha_k\}_{k \geq 0}$ be the set of eigenvalues of $-\mathcal{L}_W$. Then the set of eigenvalues of $\mathbb{I} - \mathcal{L}_W$ is $\{\gamma_k\}_{k \geq 0}$, where $\gamma_k = \alpha_k + 1$, and the eigenvectors are the same as the ones of $\mathcal{L}_W$. By item (b), we have

$$1 = \gamma_0 \leq \gamma_1 \leq \dots \text{ and } \lim_{n \rightarrow \infty} \gamma_n = \infty.$$

Thus, $\mathbb{I} - \mathcal{L}_W$ is injective, and for

$$v = \sum_{k=1}^{+\infty} v_k h_k \in L^2(\mathbb{T}^d), \text{ such that } \sum_{k=1}^{\infty} v_k^2 < +\infty,$$

let

$$u = \sum_{k=1}^{+\infty} \frac{v_k}{\gamma_k} h_k,$$

then $u \in \mathcal{D}_W$ and $(\mathbb{I} - \mathcal{L}_W)u = v$. Hence, item (c) follows.

Let $\mathcal{L}_W^* : \mathcal{D}_{W^*} \subset L^2(\mathbb{T}^d) \rightarrow L^2(\mathbb{T}^d)$ be the adjoint of $\mathcal{L}_W$. Since $\mathcal{L}_W$ is symmetric, we have $\mathcal{D}_W \subset \mathcal{D}_{W^*}$. So, to show the equality of the operators it suffices to show that $\mathcal{D}_{W^*} \subset \mathcal{D}_W$. Given

$$\varphi = \sum_{k=1}^{+\infty} \varphi_k h_k \in \mathcal{D}_{W^*},$$

let $\mathcal{L}_{W^*} \varphi = \psi \in L^2(\mathbb{T}^d)$. Therefore, for all $v = \sum_{k=1}^{+\infty} v_k h_k \in \mathcal{D}_W$,

$$\langle v, \psi \rangle = \langle v, \mathcal{L}_{W^*} \varphi \rangle = \langle \mathcal{L}_W v, \varphi \rangle = \sum_{k=1}^{+\infty} -\alpha_k v_k \varphi_k.$$

Hence

$$\psi = \sum_{k=1}^{+\infty} -\alpha_k \varphi_k h_k,$$

in particular,

$$\sum_{k=1}^{+\infty} \alpha_k^2 \varphi_k^2 < +\infty \text{ and } \varphi \in \mathcal{D}_W.$$

Thus, $\mathcal{L}_W$ is self-adjoint. Let $v = \sum_{k=1}^{+\infty} v_k h_k \in \mathcal{D}_W$. From item (b) $\alpha_k \geq 0$ and

$$\langle -\mathcal{L}_W v, v \rangle = \sum_{k=1}^{+\infty} \alpha_k v_k^2 \geq 0.$$

Therefore $\mathcal{L}_W$ is non-positive and item (d) follows.

Fix a function g in $\mathcal{D}_W$, $\lambda > 0$, and let $f = (\lambda \mathbb{I} - \mathcal{L}_W)g$. Taking inner product, with respect to g , on both sides of this equation, we obtain

$$\lambda \langle g, g \rangle + \langle -\mathcal{L}_W g, g \rangle = \langle g, f \rangle \leq \langle g, g \rangle^{1/2} \langle f, f \rangle^{1/2}.$$

Since g belongs to $\mathcal{D}_W$, by (d), the second term on the left hand side is non-negative. Thus, $\|\lambda g\| \leq \|f\| = \|(\lambda \mathbb{I} - \mathcal{L}_W)g\|$. $\square$

4. RANDOM WALK WITH CONDUCTANCES

Recall the decomposition obtained in (3.8):

$$\mathcal{L}_W = \sum_{j=1}^d \mathcal{L}_{W_j}.$$

The discrete version of $\mathcal{L}_W$ is the generator L_N of a Markov process given as follows. For each function $f : \{0, 1\}^{\mathbb{T}_N^d} \rightarrow \mathbb{R}$,

$$L_N f(\eta) = \sum_{j=1}^d L_N^j f(\eta), \quad (4.1)$$

where

$$L_N^j f(\eta) = \sum_{x \in \mathbb{T}_N^d} \xi_{x, x+e_j} c_{x, x+e_j}(\eta) [f(\eta^{x, x+e_j}) - f(\eta)].$$

In Section 2, we described, informally, the dynamics of this Markov evolution.

4.1. Discrete approximation of the operator $\mathcal{L}_W$. Let $j = 1, \dots, d$. Consider the random walks $\{X_t^j\}_{t \geq 0}$ on the discrete torus, $N^{-1}\mathbb{T}_N$, which jumps from x/N (resp. $(x+1)/N$) to $(x+1)/N$ (resp. x/N) with rate

$$N^2 \xi_{x, x+1}^j = N / \{W_j((x+1)/N) - W_j(x/N)\}.$$

Let $\{X_t = (X_t^1, \dots, X_t^d)\}_{t \geq 0}$ be the random walk on $N^{-1}\mathbb{T}_N^d$, where $\mathbb{T}_N^d$ is the discrete d -dimensional torus with N^d points.

The generator $\mathbb{L}_N$ of this Markov process acts on functions $f : \mathbb{T}_N^d \rightarrow \mathbb{R}$ as

$$\mathbb{L}_N f(x/N) = \sum_{j=1}^d \mathbb{L}_N^j f(x/N), \quad (4.2)$$

where

$$\begin{aligned} \mathbb{L}_N^j f(x/N) &= N^2 \{ \xi_{x, x+e_j} [f((x+e_j)/N) - f(x/N)] \\ &\quad + \xi_{x-e_j, x} [f((x-e_j)/N) - f(x/N)] \} \end{aligned}$$

are the generators of the one-dimensional random walks $\{X_t^j\}_{t \geq 0}$.

Note that $\mathbb{L}_N^j f(x/N)$ is in fact a discrete version of the operator $\mathcal{L}_{W_j}$. The counting measure m_N on $N^{-1}\mathbb{T}_N^d$ is reversible for this process.

4.2. Semigroups and resolvents. In this subsection we introduce families of semigroups and resolvents, associated to the generators $\mathbb{L}_N$ and $\mathcal{L}_W$. We present some properties and results regarding the convergence of these operators.

Denote by $\{P_t^N : t \geq 0\}$ (resp. $\{G_\lambda^N : \lambda > 0\}$) the semigroup (resp. the resolvent) associated to the generator $\mathbb{L}_N$, by $\{P_t^{N,j} : t \geq 0\}$ the semigroup associated to the generator $\mathbb{L}_N^j$, by $\{P_t^j : t \geq 0\}$ the semigroup associated to the generator $\mathcal{L}_{W_j}$ and by $\{P_t : t \geq 0\}$ (resp. $\{G_\lambda : \lambda > 0\}$) the semigroup (resp. the resolvent) associated to the generator $\mathcal{L}_W$.

Since the jump rates from x/N (resp. $(x + e_j)/N$) to $(x + e_j)/N$ (resp. x/N) are equal, P_t^N is symmetric: $P_t^N(x, y) = P_t^N(y, x)$.

Using the decompositions (4.2) and (3.8), we have that

$$P_t^N(x, y) = \prod_{j=1}^d P_t^{N,j}(x_j, y_j) \quad \text{and} \quad P_t(x, y) = \prod_{j=1}^d P_t^j(x_j, y_j).$$

By definition, for every $H : N^{-1}\mathbb{T}_N^d \rightarrow \mathbb{R}$,

$$G_\lambda H = \int_0^\infty dt e^{-\lambda t} P_t H = (\lambda \mathbb{I} - \mathcal{L}_W)^{-1} H,$$

where $\mathbb{I}$ is the identity operator.

Lemma 4.1. *Let $H : \mathbb{T}^d \rightarrow \mathbb{R}$ be a continuous function. Then*

$$\lim_{N \rightarrow +\infty} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H(x/N) - P_t H(x/N)| = 0. \quad (4.3)$$

Proof. If $H : \mathbb{T}^d \rightarrow \mathbb{R}$ has the form $H(x_1, \dots, x_d) = \prod_{j=1}^d H_j(x_j)$, we have

$$P_t^N H(x) = \prod_{j=1}^d P_t^{N,j} H_j(x_j) \quad \text{and} \quad P_t H(x) = \prod_{j=1}^d P_t^j H_j(x_j). \quad (4.4)$$

Now, for any continuous function $H : \mathbb{T}^d \rightarrow \mathbb{R}$, and any $\epsilon > 0$, we can find continuous functions $H_{j,k} : \mathbb{T} \rightarrow \mathbb{R}$, such that $H' : \mathbb{T}^d \rightarrow \mathbb{R}$ given by

$$H'(x) = \sum_{j=1}^m \prod_{k=1}^d H_{j,k}(x_k)$$

satisfies $\|H' - H\|_\infty \leq \epsilon$. Thus,

$$\frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H(x/N) - P_t H(x/N)| \leq 2\epsilon + \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H'(x/N) - P_t H'(x/N)|.$$

By (4.4) and similar identities for $P_t H'$ and $P_t^{N,j} H'$, the sum on the right hand side in the previous inequality is less than or equal to

$$\begin{aligned} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} \sum_{j=1}^m \left| \prod_{k=1}^d P_t^{N,k} H_{j,k}(x_k/N) - \prod_{k=1}^d P_t^k H_{j,k}(x_k/N) \right| \leq \\ \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} \sum_{j=1}^m C_j \sum_{k=1}^d |P_t^{N,k} H_{j,k}(x_k/N) - P_t^k H_{j,k}(x_k/N)|, \end{aligned}$$

where C_j is a constant that depends on the product $\prod_{k=1}^d H_{j,k}$. The previous expressions can be rewritten as

$$\begin{aligned} \sum_{j=1}^m C_j \sum_{k=1}^d \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^{d-1}} \sum_{i=1}^N |P_t^{N,k} H_{j,k}(i/N) - P_t^k H_{j,k}(i/N)| &= \\ \sum_{j=1}^m C_j \sum_{k=1}^d \frac{1}{N} \sum_{i=1}^N |P_t^{N,k} H_{j,k}(i/N) - P_t^k H_{j,k}(i/N)|. \end{aligned}$$

Moreover, by [2, lemma 4.5 item iii], when $N \rightarrow \infty$, the last expression converges to 0. $\square$

Corollary 4.2. *Let $H : \mathbb{T}^d \rightarrow \mathbb{R}$ be a continuous function. Then*

$$\lim_{N \rightarrow +\infty} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |G_\lambda^N H(x/N) - G_\lambda H(x/N)| = 0. \quad (4.5)$$

Proof. By definition of resolvent, for each N , the previous expression is less than or equal to

$$\int_0^\infty dt e^{-\lambda t} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H(x/N) - P_t H(x/N)|.$$

Corollary now follows from the previous Lemma. $\square$

Let $f_N : \mathbb{T}_N^d \rightarrow \mathbb{R}$ be any function. Then, whenever needed, we consider $f : \mathbb{T}^d \rightarrow \mathbb{R}$ an extension of f_N to $\mathbb{T}^d$ given by:

$$f(y) = f_N(x), \text{ if } x \in \mathbb{T}_N^d, y \geq x \text{ and } \|y - x\|_\infty < \frac{1}{N}.$$

Lemma 4.3. *Let $H : \mathbb{T}^d \rightarrow \mathbb{R}$ be a continuous function. then the extension of $P_t^N H : \mathbb{T}_N^d \rightarrow \mathbb{R}$ to $\mathbb{T}^d$ belongs to $L^1(\mathbb{T}^d)$, and*

$$\int_{\mathbb{T}^d} du P_t^N H(u) = \frac{1}{N^d} \sum_{x \in \mathbb{T}^d} H(x/N).$$

Proof. Assume, without loss of generality, that $H \geq 0$. Since the transition probability $P_t^N(x, y)$ is symmetric, we have

$$\begin{aligned} \int_{\mathbb{T}^d} du P_t^N H(u) &= \frac{1}{N^d} \sum_{x, y \in \mathbb{T}_N^d} P_t^N(x, y) H(y/N) = \\ \frac{1}{N^d} \sum_{y \in \mathbb{T}_N^d} H(y/N) \sum_{x \in \mathbb{T}_N^d} P_t^N(y, x) &= \frac{1}{N^d} \sum_{y \in \mathbb{T}_N^d} H(y/N). \end{aligned}$$

This proves the identity and also that $P_t^N H \in L^1(\mathbb{T}^d)$. $\square$

The next lemma shows that H can be approximated by $P_t^N H$. As an immediate consequence we obtain an approximation result involving the resolvent.

Lemma 4.4. *Let $H : \mathbb{T}^d \rightarrow \mathbb{R}$ be a continuous function, then,*

$$\lim_{t \rightarrow 0} \limsup_{N \rightarrow +\infty} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H(x/N) - H(x/N)| = 0, \quad (4.6)$$

and

$$\lim_{\lambda \rightarrow +\infty} \limsup_{N \rightarrow +\infty} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |\lambda R_\lambda^N H(x/N) - H(x/N)| = 0. \quad (4.7)$$

Proof. Fix $\epsilon > 0$ and consider H' as in the proof of Lemma 4.1. Thus,

$$\frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H(x/N) - H(x/N)| \leq 2\epsilon + \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H'(x/N) - H'(x/N)|,$$

where the second term on the right hand side is less than or equal to

$$C_0 \sup_{j,k} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^{N,k} H_{j,k}(x_k/N) - H_{j,k}(x_k/N)|,$$

C_0 being a constant that depends on H' . By [2, lemma 4.6], the last expression converges to 0, when $N \rightarrow \infty$, and then $t \rightarrow 0$. This proves the first equality.

To obtain the second limit, note that, by definition of the resolvent, the second expression is less than or equal to

$$\int_0^\infty dt \lambda e^{-\lambda t} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |P_t^N H(x/N) - H(x/N)|.$$

By lemma 4.3, the sum is uniformly bounded in t and N . By the first part of Lemma 4.3, it vanishes as $N \rightarrow \infty$ and $t \rightarrow 0$. This proves the second part. $\square$

Fix a function $H : \mathbb{T}_N^d \rightarrow \mathbb{R}$. For $\lambda > 0$, let $H_\lambda^N = G_\lambda^N H$ be the solution of the resolvent equation

$$\lambda H_\lambda^N - \mathbb{L}_N H_\lambda^N = H.$$

Taking inner product on both sides of this equation with respect to H_λ^N , we obtain

$$\begin{aligned} \lambda \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} (H_\lambda^N(x/N))^2 - \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H_\lambda^N(x/N) \mathbb{L}_N H_\lambda^N \\ = \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H_\lambda^N(x/N) H(x/N). \end{aligned}$$

A simple computation shows that the second term on the left hand side is equal to

$$\frac{1}{N^d} \sum_{j=1}^d \sum_{x \in \mathbb{T}_N^d} \xi_{x, x+e_j} [\nabla_{N,j} H_\lambda^N(x/N)]^2,$$

where $\nabla_{N,j} H(x/N) = N[H((x+e_j)/N) - H(x/N)]$ is the discrete derivative of the function H in the direction of the vector e_j . In particular, by Schwarz inequality,

$$\begin{aligned} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H_\lambda^N(x/N)^2 &\leq \frac{1}{\lambda^2} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H(x/N)^2 \text{ and} \\ \frac{1}{N^d} \sum_{j=1}^d \sum_{x \in \mathbb{T}_N^d} \xi_{x, x+e_j} [\nabla_{N,j} H_\lambda^N(x/N)]^2 &\leq \frac{1}{\lambda} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H(x/N)^2. \end{aligned} \quad (4.8)$$

We have proved the following.

Proposition 4.5. *Let $H : \mathbb{T}^d \rightarrow \mathbb{R}$ be a continuous function, $H_\lambda^N = G_\lambda^N H$, and let m_N be the counting measure on $\mathbb{T}_N^d$. Then H_λ^N and $\nabla_{N,j} H_\lambda^N$ converge to 0 when $N \rightarrow \infty$ and $\lambda \rightarrow \infty$ in $L^2(\mathbb{T}_N^d, m_N)$.*

5. SCALING LIMIT

Let $\mathcal{M}$ be the space of positive measures on $\mathbb{T}^d$ with total mass bounded by one endowed with the weak topology. Recall that $\pi_t^N \in \mathcal{M}$ stands for the empirical measure at time t . This is the measure on $\mathbb{T}^d$ obtained by rescaling space by N and by assigning mass $1/N^d$ to each particle:

$$\pi_t^N = \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} \eta_t(x) \delta_{x/N}, \quad (5.1)$$

where δ_u is the Dirac measure concentrated on u .

For a continuous function $H : \mathbb{T}^d \rightarrow \mathbb{R}$, $\langle \pi_t^N, H \rangle$ stands for the integral of H with respect to π_t^N :

$$\langle \pi_t^N, H \rangle = \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} H(x/N) \eta_t(x).$$

This notation is not to be mistaken with the inner product in $L^2(\mathbb{T}^d)$ introduced earlier. Also, when π_t has a density ρ , $\pi(t, du) = \rho(t, u) du$, we sometimes write $\langle \rho_t, H \rangle$ for $\langle \pi_t, H \rangle$.

For a local function $g : \{0, 1\}^{\mathbb{Z}^d} \rightarrow \mathbb{R}$, let $\tilde{g} : [0, 1] \rightarrow \mathbb{R}$ be the expected value of g under the stationary states:

$$\tilde{g}(\alpha) = E_{\nu_\alpha}[g(\eta)].$$

For $\ell \geq 1$ and d -dimensional integer $x = (x_1, \dots, x_d)$, denote by $\eta^\ell(x)$ the empirical density of particles in the box $\mathbb{B}_+^\ell(x) = \{(y_1, \dots, y_d) \in \mathbb{Z}^d; 0 \leq y_i - x_i < \ell\}$:

$$\eta^\ell(x) = \frac{1}{\ell^d} \sum_{y \in \mathbb{B}_+^\ell(x)} \eta(y).$$

Fix $T > 0$ and let $D([0, T], \mathcal{M})$ be the space of $\mathcal{M}$ -valued càdlàg trajectories $\pi : [0, T] \rightarrow \mathcal{M}$ endowed with the uniform topology. For each probability measure μ_N on $\{0, 1\}^{\mathbb{T}_N^d}$, denote by $\mathbb{Q}_{\mu_N}^{W,N}$ the measure on the path space $D([0, T], \mathcal{M})$ induced by the measure μ_N and the process π_t^N introduced in (5.1).

Fix a continuous profile $\rho_0 : \mathbb{T}^d \rightarrow [0, 1]$ and consider a sequence $\{\mu_N : N \geq 1\}$ of measures on $\{0, 1\}^{\mathbb{T}_N^d}$ associated to ρ_0 in the sense (2.6). Further, we denote by $\mathbb{Q}_W$ be the probability measure on $D([0, T], \mathcal{M})$ concentrated on the deterministic path $\pi(t, du) = \rho(t, u) du$, where ρ is the unique weak solution of (2.7) with $\gamma = \rho_0$, $l_k = 0$, $r_k = 1$, $k = 1, \dots, d$ and $\Phi(\alpha) = \alpha + a\alpha^2$.

In subsection 5.1 we show that the sequence $\{\mathbb{Q}_{\mu_N}^{W,N} : N \geq 1\}$ is tight and in subsection 5.2 we characterize the limit points of this sequence.

5.1. Tightness. The proof of tightness of sequence $\{\mathbb{Q}_{\mu_N}^{W,N} : N \geq 1\}$ is motivated by [6, 3]. We consider initially the auxiliary $\mathcal{M}$ -valued Markov process $\{\Pi_t^{\lambda,N} : t \geq 0\}$, $\lambda > 0$, defined by

$$\Pi_t^{\lambda,N}(H) = \langle \pi_t^N, G_\lambda^N H \rangle = \frac{1}{N^d} \sum_{x \in \mathbb{Z}^d} (G_\lambda^N H)(x/N) \eta_t(x),$$

for H in $C(\mathbb{T}^d)$, where $\{G_\lambda^N : \lambda > 0\}$ is the resolvent associated to the random walk $\{X_t^N : t \geq 0\}$ introduced in Section 4.

We first prove tightness of the process $\{\Pi_t^{\lambda,N} : 0 \leq t \leq T\}$ for every $\lambda > 0$ and we then show that $\{\Pi_t^{\lambda,N} : 0 \leq t \leq T\}$, and that $\{\pi_t^N : 0 \leq t \leq T\}$ are not far apart if λ is large.

It is well known [7] that to prove tightness of $\{\Pi_t^{\lambda,N} : 0 \leq t \leq T\}$ it is enough to show tightness of the real-valued processes $\{\Pi_t^{\lambda,N}(H) : 0 \leq t \leq T\}$ for a set of smooth functions $H : \mathbb{T}^d \rightarrow \mathbb{R}$ dense in $C(\mathbb{T}^d)$ for the uniform topology.

Fix a smooth function $H : \mathbb{T}^d \rightarrow \mathbb{R}$. Denote by the same symbol the restriction of H to $N^{-1}\mathbb{T}_N^d$. Let $H_\lambda^N = G_\lambda^N H$, so that

$$\lambda H_\lambda^N - \mathbb{L}_N H_\lambda^N = H. \quad (5.2)$$

Keep in mind that $\Pi_t^{\lambda,N}(H) = \langle \pi_t^N, H_\lambda^N \rangle$, and denote by $M_t^{N,\lambda}$ the martingale defined by

$$M_t^{N,\lambda} = \Pi_t^{\lambda,N}(H) - \Pi_0^{\lambda,N}(H) - \int_0^t ds N^2 L_N \langle \pi_s^N, H_\lambda^N \rangle. \quad (5.3)$$

Clearly, tightness of $\Pi_t^{\lambda,N}(H)$ follows from tightness of the martingale $M_t^{N,\lambda}$ and tightness of the additive functional $\int_0^t ds N^2 L_N \langle \pi_s^N, H_\lambda^N \rangle$.

A long, but simple, computation shows that the quadratic variation $\langle M^{N,\lambda} \rangle_t$ of the martingale $M_t^{N,\lambda}$ is given by:

$$\frac{1}{N^{2d}} \sum_{j=1}^d \sum_{x \in \mathbb{T}^d} \xi_{x,x+e_j} [\nabla_{N,j} H_\lambda^N(x/N)]^2 \int_0^t c_{x,x+e_j}(\eta_s) [\eta_s(x+e_j) - \eta_s(x)]^2 ds.$$

In particular, by (4.8),

$$\langle M^{N,\lambda} \rangle_t \leq \frac{C_0 t}{N^{2d}} \sum_{j=1}^d \sum_{x \in \mathbb{T}_N^d} \xi_{x,x+e_j} [(\nabla_{N,j} H_\lambda^N)(x/N)]^2 \leq \frac{C(H)t}{\lambda N^d},$$

for some finite constant $C(H)$ which depends only on H . Thus, by Doob inequality, for every $\lambda > 0$, $\delta > 0$,

$$\lim_{N \rightarrow \infty} \mathbb{P}_{\mu_N} \left[\sup_{0 \leq t \leq T} |M_t^{N,\lambda}| > \delta \right] = 0. \quad (5.4)$$

In particular, the sequence of martingales $\{M_t^{N,\lambda} : N \geq 1\}$ is tight for the uniform topology.

It remains to examine the additive functional of the decomposition (5.3). The generator of the exclusion process L_N is decomposed in generators of the random walks $\mathbb{L}_{N,j}$. By (4.1), (4.2) and a long but simple computation, we obtain that

$N^2 L_N \langle \pi^N, H_\lambda^N \rangle$ is equal to

$$\begin{aligned} & \sum_{j=1}^d \left\{ \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} (\mathbb{L}_N^j H_\lambda^N)(x/N) \eta(x) \right. \\ & \quad + \frac{a}{N^d} \sum_{x \in \mathbb{T}_N^d} [(\mathbb{L}_N^j H_\lambda^N)((x + e_j)/N) + (\mathbb{L}_{N,j} H_\lambda^N)(x/N)] (\tau_x h_{1,j})(\eta) \\ & \quad \left. - \frac{a}{N^d} \sum_{x \in \mathbb{T}_N^d} (\mathbb{L}_N^j H_\lambda^N)(x/N) (\tau_x h_{2,j})(\eta) \right\}, \end{aligned}$$

where $\{\tau_x : x \in \mathbb{Z}^d\}$ is the group of translations, so that $(\tau_x \eta)(y) = \eta(x + y)$ for x, y in $\mathbb{Z}^d$, and the sum is understood modulo N . Also, $h_{1,j}, h_{2,j}$ are the cylinder functions

$$h_{1,j}(\eta) = \eta(0)\eta(e_j), \quad h_{2,j}(\eta) = \eta(-e_j)\eta(e_j).$$

Since H_λ^N is the solution of the resolvent equation (5.2), we may replace $\mathbb{L}_N H_\lambda^N$ by $U_\lambda^N = \lambda H_\lambda^N - H$ in the previous formula. In particular, for all $0 \leq s < t \leq T$,

$$\left| \int_s^t dr N^2 L_N \langle \pi_r^N, H_\lambda^N \rangle \right| \leq \frac{(1+3|a|)(t-s)}{N^d} \sum_{x \in \mathbb{T}_N^d} |U_\lambda^N(x/N)|.$$

It follows from the first estimate in (4.8), and from Schwarz inequality, that the right hand side of the previous expression is bounded above by $C(H, a)(t-s)$ uniformly in N , where $C(H, a)$ is a finite constant depending only on a and H . This proves that the additive part of the decomposition (5.3) is tight for the uniform topology and therefore that the sequence of processes $\{\Pi_t^{\lambda, N} : N \geq 1\}$ is tight.

Lemma 5.1. *The sequence of measures $\{\mathbb{Q}_{\mu_N}^{W, N} : N \geq 1\}$ is tight for the uniform topology.*

Proof. It is enough to show that for every smooth function $H : \mathbb{T} \rightarrow \mathbb{R}$ and every $\epsilon > 0$, there exists $\lambda > 0$ such that

$$\lim_{N \rightarrow \infty} \mathbb{P}_{\mu_N} \left[\sup_{0 \leq t \leq T} |\Pi_t^{\lambda, N}(\lambda H) - \langle \pi_t^N, H \rangle| > \epsilon \right] = 0,$$

since in this case, the tightness of π_t^N follows from tightness of $\Pi_t^{\lambda, N}$. Since there is at most one particle per site, the expression inside the absolute value is less than or equal to

$$\frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} |\lambda H_\lambda^N(x/N) - H(x/N)|.$$

By Lemma 4.4 this expression vanishes as $N \uparrow \infty$ and then $\lambda \uparrow \infty$. $\square$

5.2. Uniqueness of limit points. We prove in this subsection that all limit points $\mathbb{Q}^*$ of the sequence $\mathbb{Q}_{\mu_N}^{W, N}$ are concentrated on absolutely continuous trajectories $\pi(t, du) = \rho(t, u)du$, whose density $\rho(t, u)$ is a weak solution of the hydrodynamic equation (2.7) with $l = 0 < r = 1$ and $\Phi(\alpha) = \alpha + a\alpha^2$.

Let $\mathbb{Q}^*$ be a limit point of the sequence $\mathbb{Q}_{\mu_N}^{W, N}$ and assume, without loss of generality, that $\mathbb{Q}_{\mu_N}^{W, N}$ converges to $\mathbb{Q}^*$.

Since there is at most one particle per site, it is clear that $\mathbb{Q}^*$ is concentrated on trajectories $\pi_t(du)$ which are absolutely continuous with respect to the Lebesgue

measure, $\pi_t(du) = \rho(t, u)du$, and whose density ρ is non-negative and bounded by 1.

Fix a continuously differentiable function $H : \mathbb{T}^d \rightarrow \mathbb{R}$ and $\lambda > 0$. Recall the definition of the martingale $M_t^{N, \lambda}$ introduced in the previous section. By (5.4), for every $\delta > 0$,

$$\lim_{N \rightarrow \infty} \mathbb{P}_{\mu_N} \left[\sup_{0 \leq t \leq T} |M_t^{N, \lambda}| > \delta \right] = 0.$$

By (5.3), for fixed $0 < t \leq T$ and $\delta > 0$,

$$\lim_{N \rightarrow \infty} \mathbb{Q}_{\mu_N}^{W, N} \left[\left| \langle \pi_t^N, G_\lambda^N H \rangle - \langle \pi_0^N, G_\lambda^N H \rangle - \int_0^t ds N^2 L_N \langle \pi_s^N, G_\lambda^N H \rangle \right| > \delta \right] = 0.$$

Since there is at most one particle per site, we may replace, by Corollary 4.2, $G_\lambda^N H$ by $G_\lambda H$ in the expressions $\langle \pi_t^N, G_\lambda^N H \rangle$, $\langle \pi_0^N, G_\lambda^N H \rangle$ above. On the other hand, the expression $N^2 L_N \langle \pi_s^N, G_\lambda^N H \rangle$ has been computed in the previous subsection. Recall that $\mathbb{L}_N G_\lambda^N H = \lambda G_\lambda^N H - H$. As before, we may replace $G_\lambda^N H$ by $G_\lambda H$. Let $U_\lambda = \lambda G_\lambda H - H$. Since $E_{\nu_\alpha}[h_{i,j}] = \alpha^2$, $i = 1, 2$ and $j = 1, \dots, d$, in view of (4.8), and by Corollary 5.4, for every $t > 0$, $\lambda > 0$, $\delta > 0$, $i = 1, 2$,

$$\lim_{\varepsilon \rightarrow 0} \limsup_{N \rightarrow \infty} \mathbb{P}_{\mu_N} \left[\left| \int_0^t ds \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} U_\lambda(x/N) \left\{ \tau_x h_{i,j}(\eta_s) - [\eta_s^{\varepsilon N}(x)]^2 \right\} \right| > \delta \right] = 0.$$

Since $\eta_s^{\varepsilon N}(x) = \varepsilon^{-d} \pi_s^N(\prod_{j=1}^d [x_j/N, x_j/N + \varepsilon e_j])$, we obtain, from the previous considerations, that

$$\lim_{\varepsilon \rightarrow 0} \limsup_{N \rightarrow \infty} \mathbb{Q}_{\mu_N}^{W, N} \left[\left| \langle \pi_t^N, G_\lambda H \rangle - \langle \pi_0^N, G_\lambda H \rangle - \int_0^t ds \left\langle \Phi(\varepsilon^{-d} \pi_s^N(\prod_{j=1}^d [\cdot, \cdot + \varepsilon e_j])), U_\lambda \right\rangle \right| > \delta \right] = 0.$$

Since H is a smooth function, $G_\lambda H$ and U_λ can be approximated, in $L^1(\mathbb{T}^d)$, by continuous functions. Since we assumed that $\mathbb{Q}_{\mu_N}^{W, N}$ converges in the uniform topology to $\mathbb{Q}^*$, we have that

$$\lim_{\varepsilon \rightarrow 0} \mathbb{Q}^* \left[\left| \langle \pi_t, G_\lambda H \rangle - \langle \pi_0, G_\lambda H \rangle - \int_0^t ds \left\langle \Phi(\varepsilon^{-d} \pi_s(\prod_{j=1}^d [\cdot, \cdot + \varepsilon e_j])), U_\lambda \right\rangle \right| > \delta \right] = 0.$$

Since $\mathbb{Q}^*$ is concentrated on absolutely continuous paths $\pi_t(du) = \rho(t, u)du$ with positive density bounded by 1, $\varepsilon^{-d} \pi_s(\prod_{j=1}^d [\cdot, \cdot + \varepsilon e_j])$ converges in $L^1(\mathbb{T}^d)$ to $\rho(s, \cdot)$ as $\varepsilon \downarrow 0$. Thus,

$$\mathbb{Q}^* \left[\left| \langle \pi_t, G_\lambda H \rangle - \langle \pi_0, G_\lambda H \rangle - \int_0^t ds \langle \Phi(\rho_s), \mathcal{L}_W G_\lambda H \rangle \right| > \delta \right] = 0,$$

because $U_\lambda = \mathcal{L}_W G_\lambda H$. Letting $\delta \downarrow 0$, we see that, $\mathbb{Q}^*$ a.s.,

$$\langle \pi_t, G_\lambda H \rangle - \langle \pi_0, G_\lambda H \rangle = \int_0^t ds \langle \Phi(\rho_s), \mathcal{L}_W G_\lambda H \rangle.$$

This identity can be extended to a countable set of times t . Taking this set to be dense, by continuity of the trajectories π_t , we obtain that it holds for all $0 \leq t \leq T$. In the same way, it holds for any countable family of continuous functions H . Taking a countable set of continuous functions, dense for the uniform topology, we extend this identity to all continuous functions H , because $G_\lambda H_n$ converges to $G_\lambda H$ in $L^1(\mathbb{T}^d)$, if H_n converges to H in the uniform topology. Similarly, we can show that it holds for all $\lambda > 0$, since, for any continuous function H , $G_{\lambda_n} H$ converges to $G_\lambda H$ in $L^1(\mathbb{T}^d)$, as $\lambda_n \rightarrow \lambda$.

Proposition 5.2. *As $N \uparrow \infty$, the sequence of probability measures $\mathbb{Q}_{\mu_N}^{W,N}$ converges in the uniform topology to $\mathbb{Q}_W$.*

Proof. In the previous subsection we showed that the sequence of probability measures $\mathbb{Q}_{\mu_N}^{W,N}$ is tight for the uniform topology. Moreover, we just proved that all limit points of this sequence are concentrated on weak solutions of the parabolic equation (2.7). The proposition now follows from a straightforward adaptation of the uniqueness of weak solutions proved in [3] for the d -dimensional case. $\square$

Proof of Theorem 2.2. Since $\mathbb{Q}_{\mu_N}^{W,N}$ converges in the uniform topology to $\mathbb{Q}_W$, a measure which is concentrated on a deterministic path, for each $0 \leq t \leq T$ and each continuous function $H : \mathbb{T}^d \rightarrow \mathbb{R}$, $\langle \pi_t^N, H \rangle$ converges in probability to $\int_{\mathbb{T}} du \rho(t, u) H(u)$, where ρ is the unique weak solution of (2.7) with $l_k = 0$, $r_k = 1$, $\gamma = \rho_0$ and $\Phi(\alpha) = \alpha + a\alpha^2$. $\square$

5.3. Replacement lemma. We will use some results from [7, Appendix A1]. Denote by $H_N(\mu_N | \nu_\alpha)$ the relative entropy of a probability measure μ_N with respect to a stationary state ν_α , see [7, Section A1.8] for a precise definition. By the explicit formula given in [7, Theorem A1.8.3], we see that there exists a finite constant K_0 , depending only on α , such that

$$H_N(\mu_N | \nu_\alpha) \leq K_0 N^d, \quad (5.5)$$

for all measures μ_N .

Denote by $\langle \cdot, \cdot \rangle_{\nu_\alpha}$ the scalar product of $L^2(\nu_\alpha)$ and denote by I_N^ξ the convex and lower semicontinuous [7, Corollary A1.10.3] functional defined by

$$I_N^\xi(f) = \langle -L_N \sqrt{f}, \sqrt{f} \rangle_{\nu_\alpha},$$

for all probability densities f with respect to ν_α (i.e., $f \geq 0$ and $\int f d\nu_\alpha = 1$). By [7, proposition A1.10.1], an elementary computation shows that

$$I_N^\xi(f) = \sum_{j=1}^d \sum_{x \in \mathbb{T}_N^d} I_{x, x+e_j}^\xi(f), \quad \text{where}$$

$$I_{x, x+e_j}^\xi(f) = (1/2) \xi_{x, x+e_j} \int c_{x, x+e_j}(\eta) \left\{ \sqrt{f(\sigma^{x, x+e_j} \eta)} - \sqrt{f(\eta)} \right\}^2 d\nu_\alpha.$$

By [7, Theorem A1.9.2], if $\{S_t^N : t \geq 0\}$ stands for the semi-group associated to the generator $N^2 L_N$,

$$H_N(\mu_N S_t^N | \nu_\alpha) + 2 N^2 \int_0^t I_N^\xi(f_s^N) ds \leq H_N(\mu_N | \nu_\alpha),$$

where f_s^N stands for the Radon-Nikodym derivative of $\mu_N S_s^N$ with respect to ν_α .

Remember that for a local function $g : \{0, 1\}^{\mathbb{Z}^d} \rightarrow \mathbb{R}$, $\tilde{g} : [0, 1] \rightarrow \mathbb{R}$ stands for the expected value of g under the stationary states:

$$\tilde{g}(\alpha) = E_{\nu_\alpha}[g(\eta)].$$

For $\ell \geq 1$ and d -dimensional integer $x = (x_1, \dots, x_d)$, denote by $\eta^\ell(x)$ the empirical density of particles in the box $\mathbb{B}_+^\ell(x) = \{(y_1, \dots, y_d) \in \mathbb{Z}^d; 0 \leq y_i - x_i < \ell\}$:

$$\eta^\ell(x) = \frac{1}{\ell^d} \sum_{y \in \mathbb{B}_+^\ell(x)} \eta(y).$$

For each $y \in \mathbb{B}_+^\ell(x)$, such that $y_1 > x_1$, let

$$\Lambda_{x+e_1, y}^\ell = (z_k^y)_{0 \leq k \leq M(y)} \quad (5.6)$$

be a path from $x + e_1$ to y such that:

- (1) $\Lambda_{x+e_1, y}^\ell$ begins at $x + e_1$ and ends at y , i.e.:

$$z_0^y = x + e_1 \quad \text{and} \quad z_{M(y)}^y = y;$$

- (2) The distance between two consecutive sites of the $\Lambda_{x+e_1, y}^\ell = (z_k^y)_{0 \leq k \leq M(y)}$ is equal to 1, i.e.:

$$z_{k+1}^y = z_k^y + e_j; \text{ for some } j = 1, \dots, d \quad \text{and for all } k = 1, \dots, M(y) - 1$$

- (3) The number of points $M(y)$ is bounded above by $d\ell$;

- (4) $\Lambda_{x+e_1, y}^\ell$ is injective:

$$z_i^y \neq z_j^y \quad \text{for all } 0 \leq i < j \leq M(y).$$

Lemma 5.3. *Fix a function $F : N^{-1}\mathbb{T}_N^d \rightarrow \mathbb{R}$. There exists a finite constant $C_0 = C_0(a, g, W)$, depending only on a , g and W , such that*

$$\begin{aligned} & \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} F(x/N) \int \{\tau_x g(\eta) - \tilde{g}(\eta^{\varepsilon N}(x))\} f(\eta) \nu_\alpha(d\eta) \\ & \leq \frac{C_0}{\varepsilon N^{d+1}} \sum_{x \in \mathbb{T}_N^d} |F(x/N)| + \frac{C_0 \varepsilon}{\delta N^d} \sum_{x \in \mathbb{T}_N^d} F(x/N)^2 + \frac{\delta}{N^{d-2}} I_N^\varepsilon(f), \end{aligned}$$

for all $\delta > 0$, $\varepsilon > 0$ and all probability densities f with respect to ν_α .

Proof. Any local function can be written as a linear combination of functions of type $\prod_{x \in A} \eta(x)$, for finite sets A 's. It is therefore enough to prove the lemma for such functions. We will only prove the result for $g(\eta) = \eta(0)\eta(e_1)$. The general case can be handled in a similar way.

We begin by estimating

$$\frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} F(x/N) \int \eta(x) \{\eta(x + e_1) - \frac{1}{(\varepsilon N)^d} \sum_{y \in \mathbb{B}_+^{N\varepsilon}(x)} \eta(y)\} f(\eta) \nu_\alpha(d\eta) \quad (5.7)$$

in terms of the functional $I_N^\varepsilon(f)$. The integral in (5.7) can be rewritten as:

$$\frac{1}{(N\varepsilon)^d} \sum_{y \in \mathbb{B}_+^{N\varepsilon}(x)} \int \eta(x) [\eta(x + e_1) - \eta(y)] f(\eta) \nu_\alpha(d\eta)$$

For each $y \in \mathbb{B}_+^{N^\varepsilon}(x)$, such that $y_1 > x_1$, let $\Lambda_{x+e_1,y}^\ell = (z_k^y)_{0 \leq k \leq M(y)}$ be a path like the one in (5.6). Then, by property (1) of $\Lambda_{x+e_1,y}^\ell$ and using telescopic sum we have the following:

$$\eta(x + e_1) - \eta(y) = \sum_{k=0}^{M(y)-1} [\eta(z_k^y) - \eta(z_{k+1}^y)].$$

We can, therefore, bound (5.7) above by

$$\begin{aligned} & \frac{1}{N^d} \frac{1}{(N\varepsilon)^d} \sum_{x \in \mathbb{T}_N^d} \sum_{y \in \mathbb{B}_+^{N^\varepsilon}(x)} \sum_{k=0}^{M(y)-1} \int F(x/N) \eta(x) [\eta(z_k^y) - \eta(z_{k+1}^y)] f(\eta) \nu_\alpha(d\eta) + \\ & \frac{1}{\varepsilon N^{d+1}} \sum_{x \in \mathbb{T}_N^d} |F(x/N)| \end{aligned}$$

where the last term in the previous expression comes from the contribution of the points $y \in \mathbb{B}_+^{N^\varepsilon}(x)$, such that $y_1 = x_1$. Recall that by property (2) of $\Lambda_{x+e_1,y}^\ell$, we have that $z_{k+1}^y = z_k^y + e_j$, for some $j = 1, \dots, d$.

For each term of the form

$$\int F(x/N) \eta(x) \{\eta(z) - \eta(z + e_j)\} f(\eta) \nu_\alpha(d\eta)$$

we can use the change of variables $\eta' = \sigma^{z, z+e_j} \eta$ to write the previous integral as

$$(1/2) \int F(x/N) \eta(x) \{\eta(z) - \eta(z + e_j)\} \{f(\eta) - f(\sigma^{z, z+e_j} \eta)\} \nu_\alpha(d\eta).$$

Since $a - b = (\sqrt{a} - \sqrt{b})(\sqrt{a} + \sqrt{b})$ and $\sqrt{ab} \leq a + b$, by Schwarz inequality the previous expression is less than or equal to

$$\begin{aligned} & \frac{A}{4(1-2a^-)\xi_{z,z+e_j}} \int F(x/N)^2 \eta(x) \{\eta(z) - \eta(z + e_j)\}^2 \times \\ & \times \left\{ \sqrt{f(\eta)} + \sqrt{f(\sigma^{z, z+e_j} \eta)} \right\}^2 \nu_\alpha(d\eta) + \\ & + \frac{\xi_{z,z+e_j}}{A} \int c_{z,z+e_j}(\eta) \left\{ \sqrt{f(\eta)} - \sqrt{f(\sigma^{z, z+e_j} \eta)} \right\}^2 \nu_\alpha(d\eta) \end{aligned}$$

for every $A > 0$. In this formula we used the fact that $c_{z,z+e_j}$ is bounded below by $1 - 2a^-$. Since f is a density with respect to ν_α , the first expression is bounded above by $A/(1-2a^-)\xi_{z,z+e_j}$, whereas the second one is equal to $2A^{-1}I_{z,z+e_j}^\xi(f)$.

So, by properties (3) and (4) of the path $\Lambda_{x+e_1,y}^\ell$, we obtain that (5.7) is less than or equal to

$$\begin{aligned} & \frac{1}{\varepsilon N^{d+1}} \sum_{x \in \mathbb{T}_N^d} |F(x/N)| + \frac{A}{(1-2a^-)N^d} \sum_{x \in \mathbb{T}_N^d} F(x/N)^2 \sum_{j=1}^d \sum_{k=1}^{\varepsilon N} \xi_{x+(k-1)e_j, x+ke_j}^{-1} + \\ & \frac{2\varepsilon}{AN^{d-1}} \sum_{j=1}^d \sum_{x \in \mathbb{T}_N^d} I_{x,x+e_j}^\xi(f). \end{aligned}$$

By definition of the sequence $\{\xi_{x,x+e_j}\}$, $\sum_{k=1}^{\varepsilon N} \xi_{x+ke_j, x+e_j}^{-1} \leq N[W_j(1) - W_j(0)]$. Thus, choosing $A = 2\varepsilon N^{-1}\delta^{-1}$, for some $\delta > 0$, we obtain that the previous sum is

bounded above by

$$\frac{C_0}{\varepsilon N^{d+1}} \sum_{x \in \mathbb{T}_N^d} |F(x/N)| + \frac{C_0 \varepsilon}{\delta N^d} \sum_{x \in \mathbb{T}_N^d} F(x/N)^2 + \frac{\delta}{N^{d-2}} I_N^\xi(f).$$

Up to this point we have succeeded to replace $\eta(x)\eta(x+e_1)$ by $\eta(x)\eta^{\varepsilon N}(x)$. The same arguments permit to replace this latter expression by $[\eta^{\varepsilon N}(x)]^2$, which concludes the proof of the lemma. $\square$

Corollary 5.4. *Fix a cylinder function g and a sequence of functions $\{F_N : N \geq 1\}$, $F_N : N^{-1}\mathbb{T}_N^d \rightarrow \mathbb{R}$ such that*

$$\limsup_{N \rightarrow \infty} \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} F_N(x/N)^2 < \infty.$$

Then, for any $t > 0$ and any sequence of probability measures $\{\mu_N : N \geq 1\}$ on $\{0, 1\}^{\mathbb{T}_N^d}$,

$$\limsup_{\varepsilon \rightarrow 0} \limsup_{N \rightarrow \infty} \mathbb{E}_{\mu_N} \left[\left| \int_0^t \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} F_N(x/N) \{ \tau_x g(\eta_s) - \tilde{g}(\eta_s^{\varepsilon N}(x)) \} ds \right| \right] = 0.$$

Proof. Fix $0 < \alpha < 1$. By the entropy and Jensen inequalities, the expectation appearing in the statement of the lemma is bounded above by

$$\frac{1}{\gamma N^d} \log \mathbb{E}_{\nu_\alpha} \left[\exp \left\{ \gamma \left| \int_0^t ds \sum_{x \in \mathbb{T}_N^d} F_N(x/N) \{ \tau_x g(\eta_s) - \tilde{g}(\eta_s^{\varepsilon N}(x)) \} \right| \right\} \right] + \frac{H_N(\mu_N | \nu_\alpha)}{\gamma N^d}$$

for all $\gamma > 0$. In view of (5.5), in order to prove the corollary it is enough to show that the second term vanishes as $N \uparrow \infty$, and then $\varepsilon \downarrow 0$ for every $\gamma > 0$. We may remove the absolute value inside the exponential by using the elementary inequalities $e^{|x|} \leq e^x + e^{-x}$ and $\limsup_{N \rightarrow \infty} N^{-1} \log \{a_N + b_N\} \leq \max\{\limsup_{N \rightarrow \infty} N^{-1} \log a_N, \limsup_{N \rightarrow \infty} N^{-1} \log b_N\}$. Thus, to prove the corollary, it is enough to show that

$$\limsup_{\varepsilon \rightarrow 0} \limsup_{N \rightarrow \infty} \frac{1}{N^d} \log \mathbb{E}_{\nu_\alpha} \left[\exp \left\{ \gamma \int_0^t ds \sum_{x \in \mathbb{T}_N^d} F_N(x/N) \{ \tau_x g(\eta_s) - \tilde{g}(\eta_s^{\varepsilon N}(x)) \} \right\} \right] = 0$$

for every $\gamma > 0$.

By Feynman-Kac formula, for each fixed N the previous expression is bounded above by

$$t\gamma \sup_f \left\{ \int \frac{1}{N^d} \sum_{x \in \mathbb{T}_N^d} F_N(x/N) \{ \tau_x g(\eta) - \tilde{g}(\eta^{\varepsilon N}(x)) \} f(\eta) d\nu_\alpha - \frac{1}{N^{d-2}} \hat{I}_N^\xi(f) \right\},$$

where the supremum is carried over all density functions f with respect to ν_α . Letting $\delta = 1$ in Lemma 5.3, we obtain that the previous expression is less than or equal to

$$\frac{C_0 \gamma t}{\varepsilon N^{d+1}} \sum_{x \in \mathbb{T}_N^d} |F_N(x/N)| + \frac{C_0 \gamma \varepsilon t}{N^d} \sum_{x \in \mathbb{T}_N^d} F_N(x/N)^2,$$

for some finite constant C_0 which depends on a , g and W . By assumption on the sequence $\{F_N\}$, for every $\gamma > 0$, this expression vanishes as $N \uparrow \infty$ and then $\varepsilon \downarrow 0$. This concludes the proof of the lemma. $\square$

6. ENERGY ESTIMATE

We prove in this section that any limit point $\mathbb{Q}_W^*$ of the sequence $\mathbb{Q}_{\mu_N}^{W,N}$ is concentrated on trajectories $\rho(t, u)du$ with finite energy.

Denote by ∂_{x_j} the partial derivative of a function with respect to the j -th coordinate, and by $C^{0,1_j}([0, T] \times \mathbb{T}^d)$ the set of continuous functions with continuous partial derivative in the j -th coordinate. Let $L_{x_j \otimes W_j}^2([0, T] \times \mathbb{T}^d)$ be the Hilbert space of measurable functions $H : [0, T] \times \mathbb{T}^d \rightarrow \mathbb{R}$ such that

$$\int_0^T ds \int_{\mathbb{T}^d} d(x_j \otimes W_j) H(s, u)^2 < \infty ,$$

where $d(x_j \otimes W_j)$ represents the product measure in $\mathbb{T}^d$ obtained from Lesbegue's measure in $\mathbb{T}^{d-1}$ and the measure induced by W_j :

$$d(x_j \otimes W_j) = dx_1 \dots dx_{j-1} dW_j dx_{j+1} \dots dx_d ,$$

endowed with the inner product $\langle\langle H, G \rangle\rangle_{x_j \otimes W_j}$ defined by

$$\langle\langle H, G \rangle\rangle_{x_j \otimes W_j} = \int_0^T ds \int_{\mathbb{T}^d} d(x_j \otimes W_j) H(s, u) G(s, u) .$$

Let $\mathbb{Q}_W^*$ be a limit point of the sequence $\mathbb{Q}_{\mu_N}^{W,N}$ and assume without loss of generality that the sequence $\mathbb{Q}_{\mu_N}^{W,N}$ converges to $\mathbb{Q}_W^*$.

Proposition 6.1. *The measure $\mathbb{Q}_W^*$ is concentrated on paths $\rho(t, x)dx$ with the property that for all $j = 1, \dots, d$ there exists a function in $L_{x_j \otimes W_j}^2([0, T] \times \mathbb{T}^d)$, denoted by $d\Phi/dW_j$, such that*

$$\begin{aligned} \int_0^T ds \int_{\mathbb{T}^d} dx (\partial_{x_j} H)(s, x) \Phi(\rho(s, x)) = \\ - \int_0^T ds \int_{\mathbb{T}} d(x_j \otimes W_j(x)) (d\Phi/dW_j)(s, x) H(s, x) \end{aligned}$$

for all functions H in $C^{0,1_j}([0, T] \times \mathbb{T}^d)$.

The previous proposition follows from the next lemma. Recall the definition of the constant K_0 given in (5.5).

Lemma 6.2. *There exists a finite constant K_1 , depending only on a , such that*

$$\begin{aligned} E_{\mathbb{Q}_W^*} \left[\sup_H \left\{ \int_0^T ds \int_{\mathbb{T}^d} dx (\partial_{x_j} H)(s, x) \Phi(\rho(s, x)) \right. \right. \\ \left. \left. - K_1 \int_0^T ds \int_{\mathbb{T}^d} H(s, x)^2 d(x_j \otimes W_j(x)) \right\} \right] \leq K_0 , \end{aligned}$$

where the supremum is carried over all functions $H \in C^{0,1_j}([0, T] \times \mathbb{T}^d)$.

Proof of Proposition 6.1. Denote by $\ell : C^{0,1_j}([0, T] \times \mathbb{T}^d) \rightarrow \mathbb{R}$ the linear functional defined by

$$\ell(H) = \int_0^T ds \int_{\mathbb{T}^d} dx (\partial_{x_j} H)(s, x) \Phi(\rho(s, x)) .$$

Since $C^{0,1}([0, T] \times \mathbb{T}^d)$ is dense in $L^2_{x_j \otimes W_j}([0, T] \times \mathbb{T}^d)$, by Lemma 6.2, ℓ is $\mathbb{Q}_W^*$ -almost surely finite in $L^2_{x_j \otimes W_j}([0, T] \times \mathbb{T}^d)$. In particular, by Riesz representation theorem, there exists a function G in $L^2_{x_j \otimes W_j}([0, T] \times \mathbb{T}^d)$ such that

$$\ell(H) = - \int_0^T ds \int_{\mathbb{T}^d} d(x_j \otimes W_j(x)) H(s, x) G(s, x) .$$

This concludes the proof of the proposition. $\square$

For a smooth function $H: \mathbb{T}^d \rightarrow \mathbb{R}$, $\delta > 0$, $\varepsilon > 0$ and a positive integer N , define $W_N^j(\varepsilon, \delta, H, \eta)$ by

$$\begin{aligned} W_N^j(\varepsilon, \delta, H, \eta) &= \sum_{x \in \mathbb{T}_N^d} H(x/N) \frac{1}{\varepsilon N} \{ \Phi(\eta^{\delta N}(x)) - \Phi(\eta^{\delta N}(x + \varepsilon N e_j)) \} \\ &\quad - \frac{K_1}{\varepsilon N} \sum_{x \in \mathbb{T}_N^d} H(x/N)^2 \{ W_j([x_j + \varepsilon N + 1]/N) - W_j(x_j/N) \} . \end{aligned}$$

The proof of Lemma 6.2 relies on the following result.

Lemma 6.3. *Consider a sequence $\{H_\ell, \ell \geq 1\}$ dense in $C^{0,1}([0, T] \times \mathbb{T}^d)$. For every $k \geq 1$, and every $\varepsilon > 0$,*

$$\limsup_{\delta \rightarrow 0} \limsup_{N \rightarrow \infty} \mathbb{E}_{\mu^N} \left[\max_{1 \leq i \leq k} \left\{ \int_0^T W_N^j(\varepsilon, \delta, H_i(s, \cdot), \eta_s) ds \right\} \right] \leq K_0 .$$

Proof. It follows from the replacement lemma that in order to prove the Lemma we just need to show that

$$\limsup_{N \rightarrow \infty} \mathbb{E}_{\mu^N} \left[\max_{1 \leq i \leq k} \left\{ \int_0^T W_N^j(\varepsilon, H_i(s, \cdot), \eta_s) ds \right\} \right] \leq K_0 ,$$

where

$$\begin{aligned} W_N^j(\varepsilon, H, \eta) &= \frac{1}{\varepsilon N} \sum_{x \in \mathbb{T}_N^d} H(x/N) \{ \tau_x g(\eta) - \tau_{x + \varepsilon N e_j} g(\eta) \} \\ &\quad - \frac{K_1}{\varepsilon N} \sum_{x \in \mathbb{T}_N^d} H(x/N)^2 \{ W_j([x_j + \varepsilon N + 1]/N) - W_j(x_j/N) \} , \end{aligned}$$

and $g(\eta) = \eta(0) + a\eta(0)\eta(e_j)$.

By the entropy and Jensen's inequalities, for each fixed N , the previous expectation is bounded above by

$$\frac{H(\mu^N | \nu_\alpha)}{N^d} + \frac{1}{N^d} \log \mathbb{E}_{\nu_\alpha} \left[\exp \left\{ \max_{1 \leq i \leq k} \left\{ N^d \int_0^T ds W_N^j(\varepsilon, H_i(s, \cdot), \eta_s) \right\} \right\} \right] .$$

By (5.5), the first term is bounded by K_0 . Since $\exp\{\max_{1 \leq j \leq k} a_j\}$ is bounded above by $\sum_{1 \leq j \leq k} \exp\{a_j\}$, and since $\limsup_N N^{-d} \log\{a_N + b_N\}$ is less than or equal to the maximum of $\limsup_N N^{-d} \log a_N$ and $\limsup_N N^{-d} \log b_N$, the limit, as $N \uparrow \infty$, of the second term in the previous expression is less than or equal to

$$\max_{1 \leq i \leq k} \limsup_{N \rightarrow \infty} \frac{1}{N^d} \log \mathbb{E}_{\nu_\alpha} \left[\exp \left\{ N^d \int_0^T ds W_N^j(\varepsilon, H_i(s, \cdot), \eta_s) \right\} \right] .$$

We now prove that, for each fixed i , the above limit is non-positive for a convenient choice of the constant K_1 .

Fix $1 \leq i \leq k$. By Feynman–Kac formula and the variational formula for the largest eigenvalue of a symmetric operator, the previous expression is bounded above by

$$\int_0^T ds \sup_f \left\{ \int W_N^j(\varepsilon, H_i(s, \cdot), \eta) f(\eta) \nu_\alpha(d\eta) - \frac{1}{N^{d-2}} I_N^\xi(f) \right\},$$

for each fixed N . In this formula the supremum is taken over all probability densities f with respect to ν_α .

To conclude the proof, rewrite

$$\eta(x)\eta(x + e_j) - \eta(x + \varepsilon N e_j)\eta(x + (\varepsilon N + 1)e_j)$$

as

$$\eta(x)\{\eta(x + e_j) - \eta(x + (\varepsilon N + 1)e_j)\} + \eta(x + (\varepsilon N + 1)e_j)\{\eta(x) - \eta(x + \varepsilon N e_j)\},$$

and repeat the arguments presented in the proof of Lemma 5.3. $\square$

Proof of Lemma 6.2. Assume without loss of generality that $\mathbb{Q}_{\mu_N}^{W,N}$ converges to $\mathbb{Q}_W^*$. Consider a sequence $\{H_\ell, \ell \geq 1\}$ dense in $C^{0,1_j}([0, T] \times \mathbb{T}^d)$. By Lemma 6.3, for every $k \geq 1$

$$\begin{aligned} \limsup_{\delta \rightarrow 0} E_{\mathbb{Q}_W^*} \left[\max_{1 \leq i \leq k} \left\{ \frac{1}{\varepsilon} \int_0^T ds \int_{\mathbb{T}^d} dx H_i(s, x) \{ \Phi(\rho_s^\delta(x)) - \Phi(\rho_s^\delta(x + \varepsilon e_j)) \} \right. \right. \\ \left. \left. - \frac{K_1}{\varepsilon} \int_0^T ds \int_{\mathbb{T}^d} dx H_i(s, x)^2 [W_j(x_j + \varepsilon) - W_j(x_j)] \right\} \right] \leq K_0, \end{aligned}$$

where $\rho_s^\delta(x) = (\rho_s * \iota_\delta)(x)$ and ι_δ is the approximation of the identity $\iota_\delta(\cdot) = (\delta)^{-d} \mathbf{1}_{\{[0, \delta]^d\}}(\cdot)$.

Letting $\delta \downarrow 0$, changing variables, and then letting $\varepsilon \downarrow 0$, we obtain that

$$\begin{aligned} E_{\mathbb{Q}_W^*} \left[\max_{1 \leq i \leq k} \left\{ \int_0^T ds \int_{\mathbb{T}^d} (\partial_{x_j} H_i)(s, x) \Phi(\rho(s, x)) dx \right. \right. \\ \left. \left. - K_1 \int_0^T ds \int_{\mathbb{T}^d} H_i(s, x)^2 d(x_j \otimes W_j(x)) \right\} \right] \leq K_0. \end{aligned}$$

To conclude the proof, it remains to apply the monotone convergence theorem and recall that $\{H_\ell, \ell \geq 1\}$ is a dense sequence in $C^{0,1_j}([0, T] \times \mathbb{T}^d)$ for the norm $\|H\|_\infty + \|(\partial_{x_j} H)\|_\infty$. $\square$

ACKNOWLEDGMENTS

I would like to thank Claudio Landim for giving constant encouragement and several ideas and suggestions that helped in the elaboration of this work. Finally, I would also like to thank Alexandre Simas for his valuable comments.
